

Python Dictionary Methods - Quick Reference

Commonly used dictionary methods with examples.

Method	Description	Example
clear()	Removes all items	d.clear()
copy()	Returns a shallow copy	new_d = d.copy()
fromkeys()	Creates a dictionary from keys	dict.fromkeys(['a','b'], 0)
get()	Returns value for a key	d.get('name')
items()	Returns key-value pairs	d.items()
keys()	Returns all keys	d.keys()
values()	Returns all values	d.values()
pop()	Removes specified key	d.pop('age')
popitem()	Removes last inserted pair	d.popitem()
setdefault()	Gets value or inserts default	d.setdefault('city','Delhi')
update()	Updates dictionary	d.update({'age':20})

Example Code

```
student = {
    "name": "Daksh",
    "age": 19,
    "course": "AI"
}

print(student.get("name"))
print(student.keys())
print(student.values())
print(student.items())
student.update({"age": 20})
student.setdefault("city", "Jaipur")
student.pop("course")
new_student = student.copy()
new_student.clear()
```

Most Important Methods for Interviews

- get()
- keys()
- values()
- items()
- update()
- pop()
- popitem()
- setdefault()

- copy()
- clear()
