

Most Used Tuple Methods in Python

1. count()

Returns the number of times a specified value appears in the tuple.

Example:

```
t = (1, 2, 3, 2, 4, 2)
print(t.count(2)) # Output: 3
```

2. index()

Returns the first index of a specified value in the tuple.

Example:

```
t = ('a', 'b', 'c', 'a', 'b')
print(t.index('b')) # Output: 1
```

With start index:

```
print(t.index('b', 2)) # Output: 4
```

Other Useful Tuple Operations (not methods)

Although tuples have only two methods, you can use these built-in functions:

- len(t): Returns the number of elements.
- min(t) / max(t): Returns the smallest/largest element.
- sum(t): Returns the sum of elements (if numeric).
- 'in': Checks if a value exists in the tuple.
- tuple(): Converts another sequence to a tuple.
- sorted(t): Returns a sorted list from the tuple.
- Slicing: t[1:4] extracts part of the tuple.
- Unpacking: a, b = (1, 2)

Most Used Tuple Methods in Python

Summary

Built-in Tuple Methods:

- `count(value)`: Count occurrences.
- `index(value)`: Find first index of value.
